Special Release Notification: The National Marine Fisheries Service Biological Opinion for the Salinas Valley Water Project uses water year type categories to determine certain operational requirements related to steelhead passage in the Salinas River system. Water year type is forecast on March 15th and April 1st of each year using daily streamflow at the Arroyo Seco near Soledad USGS stream gage. The April 1st forecast for water year 2018 is for a dry year type. In dry year types, the MCWRA is required to bypass a minimum of 2 cfs past the Salinas River Diversion Facility (SRDF) to the Salinas River Lagoon any time the SRDF is operating or when conservation releases are being made.

Currently, the MCWRA is making conservation releases for groundwater recharge and SRDF operations. For details related to NMFS flow requirements in the Salinas River see:
